Botanical name	Anemone coronaria De Caen Group
Delivery size	30 tubers for planting · not flowering potted plants
Family	Ranunculaceae
Life span	Perennial; with above-ground resting phase
Flower colour	Red, pink, white and violet-blue mix; variable distribution
Flowering time	Spring to early summer, depending on planting and cultivation; timing dependent on weather and position
Expected height	About 30–40 cm at flowering; not delivery height
Planting time	Preferably spring outdoors; autumn only with suitable protected cultivation
Spacing	About 15 cm as a guide for De Caen anemones
Depth	About 5 cm; consider packaging and soil
Position	Sunny sheltered; loose freely draining soil

Care at a glance

Observe, check and adapt care to the position and season. This table provides guidance for everyday practice.

Topic	What to do	Why it helps
Light	Choose a sunny sheltered site.	Mediterranean garden anemone, not woodland anemone.
Soil	Prepare loose and freely draining.	Persistent wetness poorly suits tubers.
Preparation	Soak dry tubers for a few hours before planting.	Plant promptly afterwards in prepared soil.
Planting time	Preferably spring outdoors; autumn only protected.	Plan weather and winter cultivation.
Planting	Set about 5 cm deep and 15 cm apart.	Specialist guide; also follow actual packaging.
Water	Supply according to soil moisture during growth.	Check free drainage especially in containers.
Rest	Keep the tuber site dry after foliage dies back.	No permanent summer watering.
Winter	Plan protected cultivation in cold regions.	A container can be moved as needed.

Knowledge that grows

A little bowl full of colour

Garden anemone opens its flowers like little colourful bowls. Broad petals in red, violet-blue, pink or white surround the usually dark centre. Beneath sits finely divided almost parsley-like foliage. De Caen Mix combines several shades without every small group looking alike. Flowers and leaf patterns can be viewed closely beside a sunny garden path. The mixture is attractive in a terrace container too: upright stems bring colour above the rim without making a large shrub.

Thirty tubers that must grow first

The offer contains thirty tubers for planting. Flowering photographs show a later garden moment; a planted container is not included. We do not use the shop title's commercial grade as a personally measured diameter. Divide planting material into a few loose groups rather than fill every free site equally densely. Individual flowers can then be distinguished. In a mixture, exact colour distribution is open. Plan a colourful combination rather than an order with a fixed number of red or white blooms.

Sun needs a dry retreat

Anemone coronaria belongs to Mediterranean anemones. A sunny sheltered site and soil with good drainage are the starting point. A moist corner beneath a densely leafy tree suits other anemones better than this group. Check after rain whether water stands on the planned area for long. Container holes must stay open. Plants need water during sprouting; during later rest the tuber site should remain dry. This change matters more than a rigid weekly watering amount.

Plant according to season and weather

The RHS recommends spring for outdoor planting. Autumn planting needs a mild sheltered site or protected container cultivation. Soak dry tubers for a few hours in clean water before planting. The specialist supplier gives about five centimetres depth and fifteen centimetres spacing as De Caen guidance. Tubers need not be aligned towards an unmistakable tip. Follow package instructions too. Prepare ground before soaking so planting material can be planted promptly afterwards.

Accompany shoots without saturating soil

Check soil moisture during growth and flowering. A small container may dry quickly on a sunny day but must not stand permanently in water. Water near ground when soil needs it. In a nutrient-containing border, blanket extra fertilising is not the first step. In containers adapt supplies to substrate, growth and fertiliser label. Watch young shoots for slugs. If a plant appears weak, inspect the actual root site and moisture before responding with extra water or fertiliser.

Preserve a rest site after flowering

Let foliage complete its yearly cycle. Summer is not a period of permanently wet soil for these tubers. A movable container can be sheltered from persistent rain after flowering. Winter space also belongs in planning in cold regions; sheltered frost-free container quarters may be more sensible than a blanket frost promise. Do not place tubers and plants among food and keep away from curious pets. Gloves are a practical choice when handling planting material.

Recognise the mixture next year

Photograph a whole group and one open flower. Record planting date, position and start of flowering in the plant book. Also note whether cultivation was in a border or container: these places respond differently to rain and sun. The attractive colour mixture becomes understandable personal garden experience. When a corner disappoints, comparing observations often helps more than immediately changing all care steps.

Pictures and details

Images and descriptions from this portrait. Decorative items are not included in the offer.

AI-created detail of later flowering; not delivery condition.

Original shop picture of later flowering. Offer: 30 tubers for planting, not ready-planted containers.

Good to know

What is in the offer?

Thirty tubers for planting, not flowering potted plants.

Are colours divided in fixed amounts?

No. Distribution in the mix may vary.

How tall do plants grow?

The De Caen Group often reaches about 30–40 cm; site and cultivation influence growth.

When should I plant in the garden?

Preferably spring. Autumn planting needs suitable winter and wetness protection.

Do tubers need much summer water?

They should stay dry during the above-ground resting phase.

Can I keep them in containers?

Yes, with sun, permeable soil and good drainage.
