Cornus sanguinea 'Anny's Winter Orange'

Anny’s Winter Orange dogwood: green youngster to warm winter bark

Summer green leaves/winter warm orange twigs change garden through seasons. Small delivery plant first needs roots/water before renewal pruning.

AI scene from young green shop original, reference 6 plants/9 cm pot/10–25 cm total including pot. Garden/accessories excluded, not scale photo/winter colour guarantee.

Botanical name	Cornus sanguinea ‘Anny’s Winter Orange’ ·Cornaceae
Delivery size	6 plants/9 cm pot/10–25 cm total including pot
Life/habit	Perennial woody deciduous branching/suckering shrub
Later size	Approx. 1.5–2.5 m high/wide garden guidance; site/prune, free older may grow larger
Flowering	Late spring/early summer, development/prune affect set
Flowers	Small creamy–white/whitish in flat heads
Planting	Prefer autumn, spring also frost–free/not waterlogged ground
Spacing	Hedge approx. 80–100 cm offer; solitary plan later width

Care at a glance

Observe, check and adapt care to the position and season. This table provides guidance for everyday practice.

Topic	What to do	Why it helps
Arrival	Check small ball/protected care until planting.	Young shrub first healthy roots not hard cuts.
Site	Sun/partial shade with moist draining earth.	Light supports winter bark, permanent wet harms roots.
Plant	Prefer autumn or spring same ball level.	Frost-free workable earth eases establishment/contact.
Spacing	Hedge 80–100 cm shop guide/solitary future space.	Small plants develop broad branches.
Water	Check the rootball and garden soil; when dry, water slowly at soil level.	Wet surface not moisture proof inside old pot ball.
Mulch	Loose cover/base free.	Holds moisture without burying shoot bases.
Prune	Establish first, later late winter–spring by vigour.	Young stems give colour, hard cut reduces flowers.
Suckers	Early check shoots outside intended area.	Shrub can expand sideways.
Pot	Generous root space/drainage/protected winter site.	Small delivery ball not permanent container culture.

Knowledge that grows

Colour waits under summer leaves

Name not visible daily. Summer opposite oval green leaves/pointed ends/curved veins. Leaf fall exposes young warm orange bark/reddish tips. Deciduous *Cornus sanguinea* branching framework. Small creamy-white late spring-early summer heads of many flowers, not large white Canadian-dogwood bracts. Strong winter twig display changes light/shoot age/weather.

Six little pots first need roots

Offer 6 plants 9 cm pots/10–25 cm total including pot. Green young loosely branched original, not orange winter hedge delivered. Check moist balls/keep sheltered until planted. Individual young branch can be longer/wider. Future 1.5–2.5 m high/wide guide over years, site/prune affect, free older shrub may exceed.

Plan winter view with site

Choose also by viewing window/path. Sun supports strong colour, partial shade possible/deep shade weakens. Calm dark background shows warm bark better than mixed shrub wall. Ground holds moisture/drains surplus, always dry sand as unsuitable as airless wet hole. Space underneath for suckers/side expansion, narrow path-edge later more cuts/thinning.

Plant while ground and ball connect

Autumn frost-free workable soil good, spring possible monitor ensuing dry spell. Moisten dry rootballs first/loosen connected ground rather than tiny compact holes. Old pot level/gently firm/thorough water. 80–100 cm hedge offer guidance not immediately closed stand. Solitary room for later spread, loose mulch away trunk foot.

Moist soil beats frequent top-ups

Establishing check old ball/adjacent ground. Rain dark surface not necessarily dense little ball wet throughout. Dry: slow base water reaching roots. Already wet extra no use, check outflow. Established help prolonged drought. Poor ground modest feed after spring prune may suit by soil/actual growth, not desire many orange twigs. Large vessel ongoing moisture/drainage; 9 cm not permanent home.

Renew colour without exhausting youngster

Strong young stems colour best. Hard prune renews but new planting first about two years rooting. Developed shrub late winter-spring by weather/vigour. Not universally full annual coppice: longer intervals/selective old wood may suit. Weak plants ease/care first not automatic low cut. Hard renewal reduces flower/later fruit set, choose seasonal priority.

Orange bark is seasonal

After leaf fall inspect/mark old stems. Brown dry tips not wanted colour shift, check living wood beneath. Spotted leaves/dying branches interpreted with ground/site. Suckers outside area early before neighbour bed. Pot ball more frost/drought exposed than ground, shelter/root protection useful. Anny's and Midwinter Fire separate named cultivars, stronger orange here no substitute for care/unchanging colour guarantee.

Pictures and details

Images and descriptions from this portrait. Decorative items are not included in the offer.

AI original-based leaf detail, green stage not cultivar diagnosis by winter colour.

Clean unchanged young-delivery original6 plants/9 cm pot/10-25 cm total pot included, no winter bark display yet.

Good to know

Why arrives green not orange?

Young delivery leafy growth stage, warm bark strongest after leaf fall by light/stem age.

How large?

Approx. 1.5–2.5 m high/wide guide, free can larger, site/prune shape.

When plant small pots?

Prefer autumn/spring frost-free workable ground, prewet ball/controlled care.

Six spacing?

Shop approx. 80–100 cm hedge, solitary future width; not crowd six in tiny bed.

Hard cut freshly planted?

Wait strong rooting usually about two years, first moisture/healthy structure.

Remove all yearly?

No, interval/intensity by vigour, selectively thin old; strong cut reduces flowers/fruit.

Same as Midwinter Fire?

Separate *Cornus sanguinea* cultivars. Anny's stronger orange description; both need space/moist soil/appropriate renewal.
