Beauty: a green ornamental shrub with yellow flowers and red fruit views

Beauty combines small yellow flowers with green oval leaves and later ornamental fruit. The original gallery shows striking red fruit on a developed planting. A garden position rewards the journey from young delivery plant to a shrub about 80-100 cm tall.

AI-created garden scene of one young plant based on the original shop photo. Each 9 cm pot · approx. 10-25 cm total height · count according to set. The selected offer determines count; accessories and setting are not included in delivery.

Grow with knowledge.

A collection for observation and reference. Detailed explanations to help you make care decisions suited to your plant and its position.

Botanical classification	Hypericum × inodorum 'Beauty'
Delivery size	Each 9 cm pot · approx. 10–25 cm total height · count according to set
Family	Hypericaceae
Habit	Perennial woody ornamental shrub; leaf retention depends on site and winter
Flower colour	Yellow
Flowering time	Summer; about June to August, through September depending on cultivation
Expected height	About 80–100 cm as cultivar guidance; spread roughly 90 cm in the cultivation profile
Spacing	Shop guide 40–50 cm for groups; allow more sideways space for separate shrubs
Planting time	Spring or early autumn in frost-free workable soil
Position	Sun to partial shade; fresh well-drained soil

Care at a glance

Observe, check and adapt care to the position and season. This table provides guidance for everyday practice.

Topic	What to do	Why it helps
Light	Choose sun to partial shade in a visible garden spot.	The annual picture switches between leaves, flowers and fruit.
Soil	Provide fresh well-drained soil.	The future shrub crown needs reliable root conditions.
Planting	Plant the moist ball at its old height and water in.	Soil contact enables further rooting.
Water	Check moisture at the root ball, not only the surface.	The young sales-pot zone has limited reserves.
Feeding	Supply modestly as needed during spring growth.	Extra nutrients alone do not guarantee fruit.
Spacing	Plan later width beside small perennials.	Dense groups grow together and easily obscure lower neighbours.
Pruning	Remove dead wood in spring and arrange the desired form.	A clear framework makes leaf and shoot checks easier.
Pot	Protect a larger outdoor container and keep drainage open.	The older cultivar needs more root space than the small delivery plant.

Knowledge that grows

A fruit picture belonging to the garden year

Beauty stands out in original photos with red berry-like fruits among oval green leaves. Before them come yellow flowers with many stamens. The shrub therefore offers different points of interest: living green structure first, then summer flowers and later ornamental fruit. A place near a path invites close observation of these changes. The young potted plant need not yet carry that later picture. Inferring immediately fruiting delivery from the red fruit photo would mislead. Look at the actual original view of the small plant and plan the developed shrub as a later possibility.

Beauty stays this specific garden selection

Beauty here names a distinct selection of *Hypericum × inodorum*. Producer ranges list it independently of Magical Beauty. A short similar name is not enough to borrow particular fruit colours or features from that other trade selection. This portrait stays with the offered Beauty and its original photos. It is a woody ornamental shrub. Yellow flowers alone do not reliably distinguish St John's worts; form, leaves and fruit also matter. Keep the full cultivar name for your garden decision rather than classing it as any low yellow St John's wort.

Separate free shrub space from set size

Delivery starts in a 9 cm pot at about 10–25 cm total height including pot. A developed Beauty shrub may reach roughly 80–100 cm. The cultivation profile guides spread at around 90 cm. This noticeably changes its relationship with lower perennials. Shop spacing of 40–50 cm suits a group growing together, not permanently separate small individuals. Lay sets out before planting and consider future side branches too. Allow more space if each shrub should remain a visible individual shape. Ordered count describes delivery contents, not suitable garden size.

Good garden soil lies beneath visible green

Sun and partial shade suit Beauty. Choose soil providing moisture while draining excess water. A moist surface is not a reliable sign of deeper root-ball conditions, especially with a younger shrub. Compacted subsoil may hold water after heavy rain; near a warm wall, its small root zone may dry quickly instead. Prepare the area for these real conditions. A container needs sufficient space, stable soil structure and open drainage. Later colourful fruit is supported by the whole healthy plant, not just a pretty sunny picture spot.

From small root ball into the first shrub season

Spring or suitable early autumn work well for the start if soil is frost-free and not waterlogged. Moisten the ball thoroughly and plant at its old height. Bring soil into side contact and water slowly. During establishment, check at the planting site that water actually reached the ball. An older large shrub uses a wider soil area; the young plant cannot yet. For little initial growth, check moisture, light and soil contact before adding fertiliser. Modest feeding according to need goes further than a blanket high fertiliser plan.

Fruit views do not replace leaf checks

Yellow flowers open in summer, often June to August and sometimes into September in suitable conditions. Fruit appears afterwards or among further flowers. Development and quantity depend on the year. Treat fruit decoratively, not as something to snack on. Regularly check leaves for unusual spots or coatings too. Normally ageing foliage differs from a change on many young shoots. For a shrub with changing colours, look precisely at where the change occurs. Raising water or fertiliser together does not explain why certain leaves suddenly appear damaged.

Support the older framework with calm pruning

In spring, first look at living wood and fresh growth. Remove dead or badly placed branches with clean tools; further correction follows the desired shape. A winter with fewer leaves does not automatically require the same action as a dead shoot. Container plants remain protected outdoors with appropriate root protection and free drainage. Check moisture on frost-free days, especially where little rain reaches. Sideways development becomes clearer over the years. Keep paths and lower neighbours free so Beauty remains a distinct green shape with changing flowers and fruit.

Pictures and details

Good to know

Is Beauty the same as Magical Beauty?

The portrait follows Beauty offered independently and listed separately by producers; Magical Beauty features are not transferred.

How large does Beauty grow?

About 80–100 cm tall and roughly 90 cm wide as cultivation guidance, not an exact promise.

What colour are its flowers?

Yellow. Striking later ornamental fruit belongs to another development phase.

Should I expect a fruiting delivery?

No. Original fruit images show developed plants, not guaranteed features of the young order.

Are the fruits for eating?

They are treated as ornamental fruit and not offered for consumption.

Can Beauty stay permanently in a 9 cm pot?

The small sales pot is for the start. An older shrub needs sufficient root space and free drainage.
