

PLANTS TO READ ABOUT

Three small conifers: green forms with a place for later

Yellow-green, blue-green and darker branches may come together in this small set. Conifers are selected according to stock. Their young delivery condition suits getting acquainted; species, spread and root space matter for later planting.

AI-created example scene based on the original shop photograph. Specific composition may change; scene containers and decoration are not included in the delivery.

Grow with knowledge.

A collection for observation and reference. Detailed explanations to help you make care decisions suited to your plant and its position.

Changing selection of conifers according to the shop offer

Three small conifers: green forms with a place for later

Yellow-green, blue-green and darker branches may come together in this small set. Conifers are selected according to stock. Their young delivery condition suits getting acquainted; species, spread and root space matter for later planting.

AI-created example scene based on the original shop photograph. Specific composition may change; scene containers and decoration are not included in the delivery.

Botanical name	Changing selection of conifers according to the shop offer
Delivery size	3 plants · each in a 10.5 cm pot · overall height about 15–30 cm
Composition	Three different conifers; no fixed species or variety list
Lifespan	Perennial woody plants, offered by the shop as a hardy selection
Foliage display	Green, yellowish or bluish shades according to selection and season
Flowering time and colour	No ornamental flowers guaranteed for the changing set
Planting	Autumn or spring in frost-free, non-waterlogged soil
Expected height	Depends on species and variety; small delivery size is no certain final size
Planting distance	Determine by later spread and intended use
Position	Bright outdoor position; exact light and soil needs according to the plant label

Care at a glance

Observe, check and adapt care to the position and season. This table provides guidance for everyday practice.

Topic	What to do	Why it helps
Planning	Keep the three labels and check later height and spread.	Even slow-growing conifers may outgrow their original pot position.
Light	Keep brightly outdoors and observe variety-specific sun needs.	A pretty branch colour does not replace a suitable long-term position.
Water	Water each young root ball thoroughly in good time.	Freshly planted woody plants and small pots cannot yet draw water from a wide soil area.
Drainage	Provide clear holes and a permeable root zone.	Persistently wet soil can cause brown branches just as dryness can.
Planting	Plant at the existing root-ball level and water the soil in.	A deeply buried trunk base is kept unnecessarily moist.
Feeding	In containers during growth, feed moderately according to the fertiliser label.	In a bed, extra food depends on soil and development.
Pruning	Shape selectively and do not cut into bare old wood without checking.	Many conifers do not reliably reshoot there.
Winter	Keep sheltered outdoors, insulate containers and check moisture in frost-free soil.	Leafy branches lose water in winter too; frozen roots have difficulty replenishing it.

Knowledge that grows

Differences are found on the branches

Three small conifers are especially rewarding to look at closely. An upright fan of branches looks different from a low broad structure; yellowish foliage stands out beside a bluish or deep-green neighbour. The offer is called a dwarf conifer set, but its specific species and variety selection changes with season and availability. We therefore do not compile three binding botanical names from the example image. Differences in your actual delivery are the starting point. Keep their labels, because these provide later decisions about position, pruning and space.

Small delivery plant and permanent dwarf are two questions

Three plants are supplied, each in a ten-and-a-half-centimetre pot at an overall height of about fifteen to thirty centimetres. When young, they fit into small displays and are convenient to care for separately. These delivery measurements do not yet answer how large each woody plant becomes over years. Even slow growth does not automatically mean a fixed final height. Before permanently planting beside a narrow path, a wall or in a small bowl, check the identified species or varieties and their development. Our scene shows the young beginning, not three mature miniature trees.

A bright outdoor position reveals the structure

Conifers from this garden offer remain outdoors. A bright sheltered place helps acclimatisation; exact sun tolerance follows the actual selection. After transport, do not immediately put a dry small root ball in an overheated corner. Consider the place in the afternoon too: a terrace wall may store considerable heat, while an open corner receives strong wind. The three pots may look good together, but branches should not remain tightly pressed into each other. Free space simplifies moisture checks and preserves different growth forms without immediately matching them with shears.

Consider later root space when planting

Autumn and spring often offer good establishment conditions if soil is frost-free and not waterlogged. Loosen a sufficiently large area rather than making a tiny hole in compacted soil. Plant at the existing root-ball level and water carefully afterwards. In a container, drainage, adequate volume and stability must work together. Three pots alone do not make the set a permanent miniature hedge: different growth may be appealing in a group but needs suitable distances. Set these according to later width. Small free gaps provide a useful reserve for new branches and roots.

Firm branches need supplied root balls too

Feel the soil before watering and lift the small pots. When needed, water slowly and thoroughly until the root ball is supplied and excess can drain. A dried root zone is not compensated by a quick spray on foliage. Newly planted woody plants need attention during establishment, even if larger rooted specimens later need less help. Container supplies still need more regular checks. During vigorous growth, consider existing soil and nutrient reserves before feeding moderately according to the label. Brown branches are no automatic sign of fertiliser shortage.

Shape without losing the green edge

An individual troublesome young shoot can be assessed selectively. A complete little hedge haircut by calendar does not suit all three woody plants in general. Many conifers respond poorly to cutting far into bare brown wood and do not reliably close resulting gaps. Preserve a green finish where possible and check the actual species before stronger work. Low broad growth need not become a narrow cone. The three plants may keep their differences for a living display. Work with clean tools and avoid major pruning in strong heat or drought stress.

Do not forget winter; reassess in spring

The set is offered as hardy, but roots in a small pot are more exposed than in a bed. Position containers in shelter, insulate if needed and let water drain freely. Check moisture on frost-free days; leafy branches may lose water even in cool air. A warm living room is no better winter quarters for these garden plants. After winter, assess brown parts together with frost, wind, dryness and wetness instead of immediately shortening everything. Healthy new growth helps assessment. Note which woody plant needs more space so the next season starts with a suitable decision.

Pictures and details

Good to know

Do all three remain 15-30 cm tall permanently?

No. These measurements describe delivery including the pot. Later size depends on the actual species or variety.

Will I receive exactly the three plants in the picture?

Composition changes. The original photograph and scene show examples.

Can I make a hedge from them?

Only after checking species, growth and distances. Three different young woody plants do not automatically create a uniform permanent hedge.

Why should I not cut into brown wood?

Many conifers do not reliably reshoot there. Stronger pruning needs a species-specific decision.

Do they need water in winter?

Check when soil is frost-free. Even leafy garden plants may dry out in winter containers.

Can the set stay on the desk?

It is a garden offer. A suitable bright outdoor position and natural seasons belong to long-term cultivation.
